Life Cycle Sustainability Assessment of rare earth permanent magnets

22.09.2016

Christina Wulf, Petra Zapp, Andrea Schreiber, Josefine Marx, Holger Schlör

Member of the Helmholtz Association

Agenda

Introduction

System description

Approaches single assessments

Results single assessments

Approach multi-criteria decision-making

Results multi-criteria decision-making

Conclusions

Introduction

- Rare earth (RE) magnets are part of wind power plants (increase of renew-ables → higher demand)
- RE are considered as critical resource
- Known environmental problems during production

Source: Siemens

Comparison of Chinese process chain with two western process chains (Australia/Malaysia; U.S.) within a 4-years project with Aachen University and Siemens AG

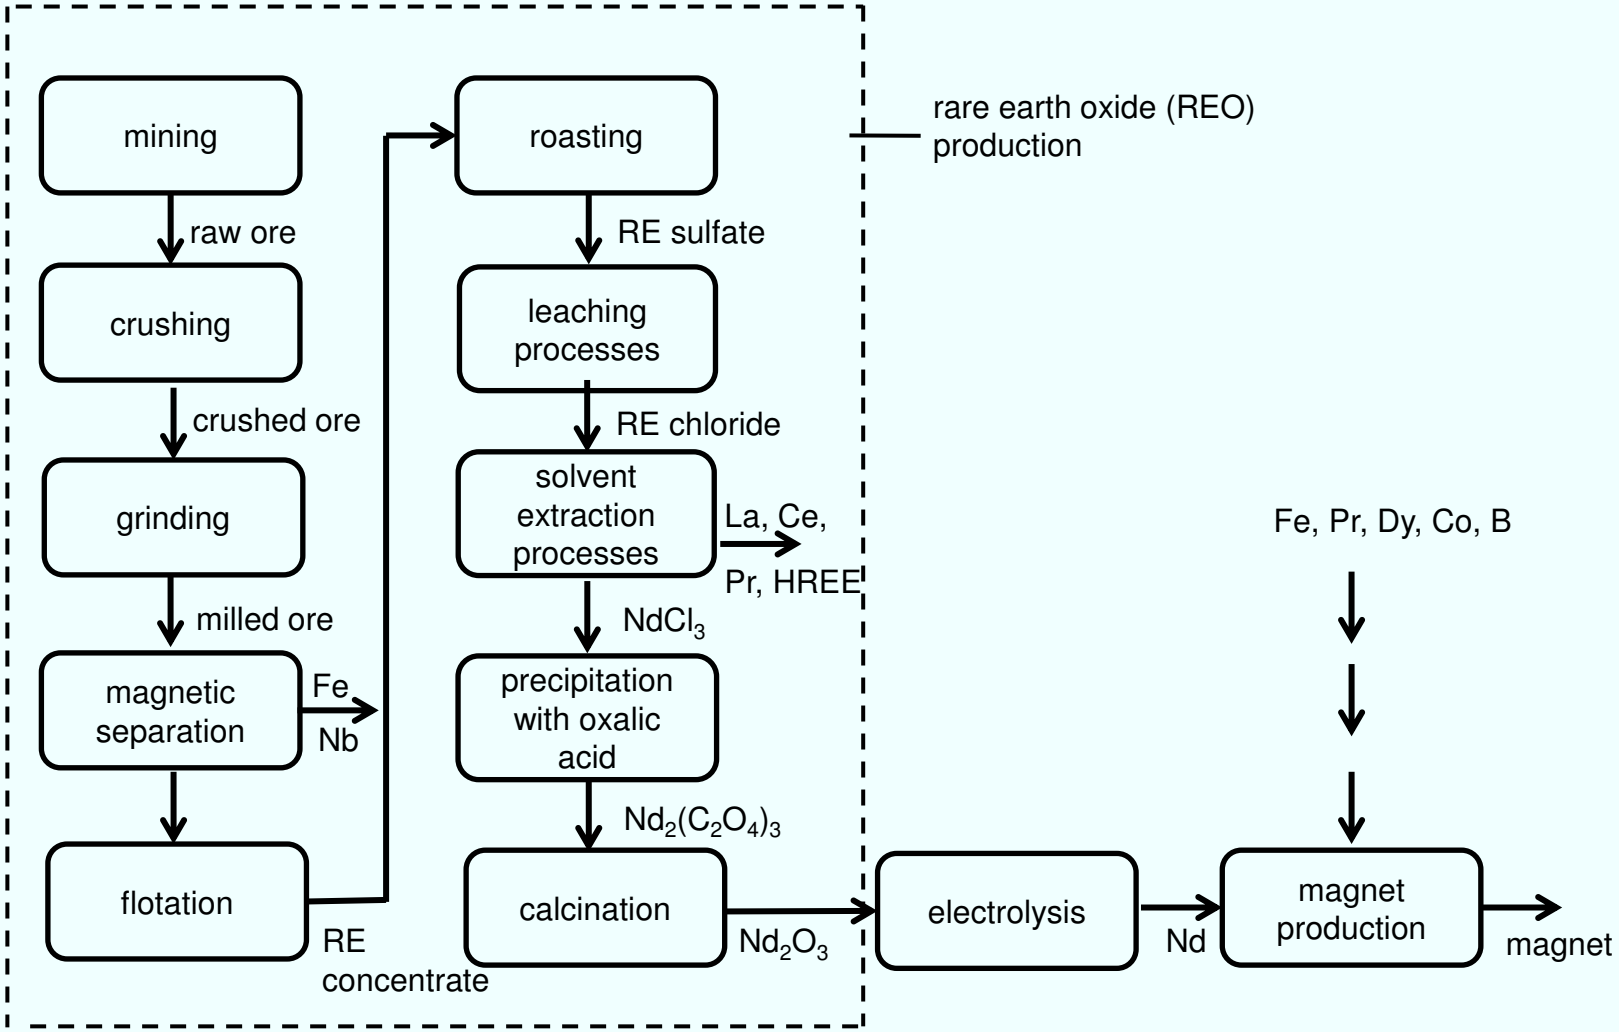
System description example China, Nd



Life Cycle Assessment

Ecoinvent 2.2 + Gabi

ReCiPe 1.08 midpoint (H)

- Fossil Fuel Depletion
- Climate Change
- Terrestrial Acidification
- Freshwater Eutrophication
- Ozone Depletion
- Photochemical Oxidant Formation
- Human Toxicity
- Terrestrial Ecotoxicity
- Freshwater Ecotoxicity
- Ionizing Radiation
- Particulate Matter Formation

Member of the Helmholtz Association

Life Cycle Costing

- Top down approach
- Basis: published CAPEX and OPEX of REOs
- Own calculations (Siemens AG) of CAPEX and OPEX for metal and magnet production
- Sum of CAPEX and OPEX results in Total Cost of Ownership (US$/kg magnet)

Supply Chain	CAPEX Mio. US	OPEX US$/kg REO
Australia	1125	10.11
U.S.	895	27.70
China	595	5.58

Social Life Cycle Assessment

Social hotspots database

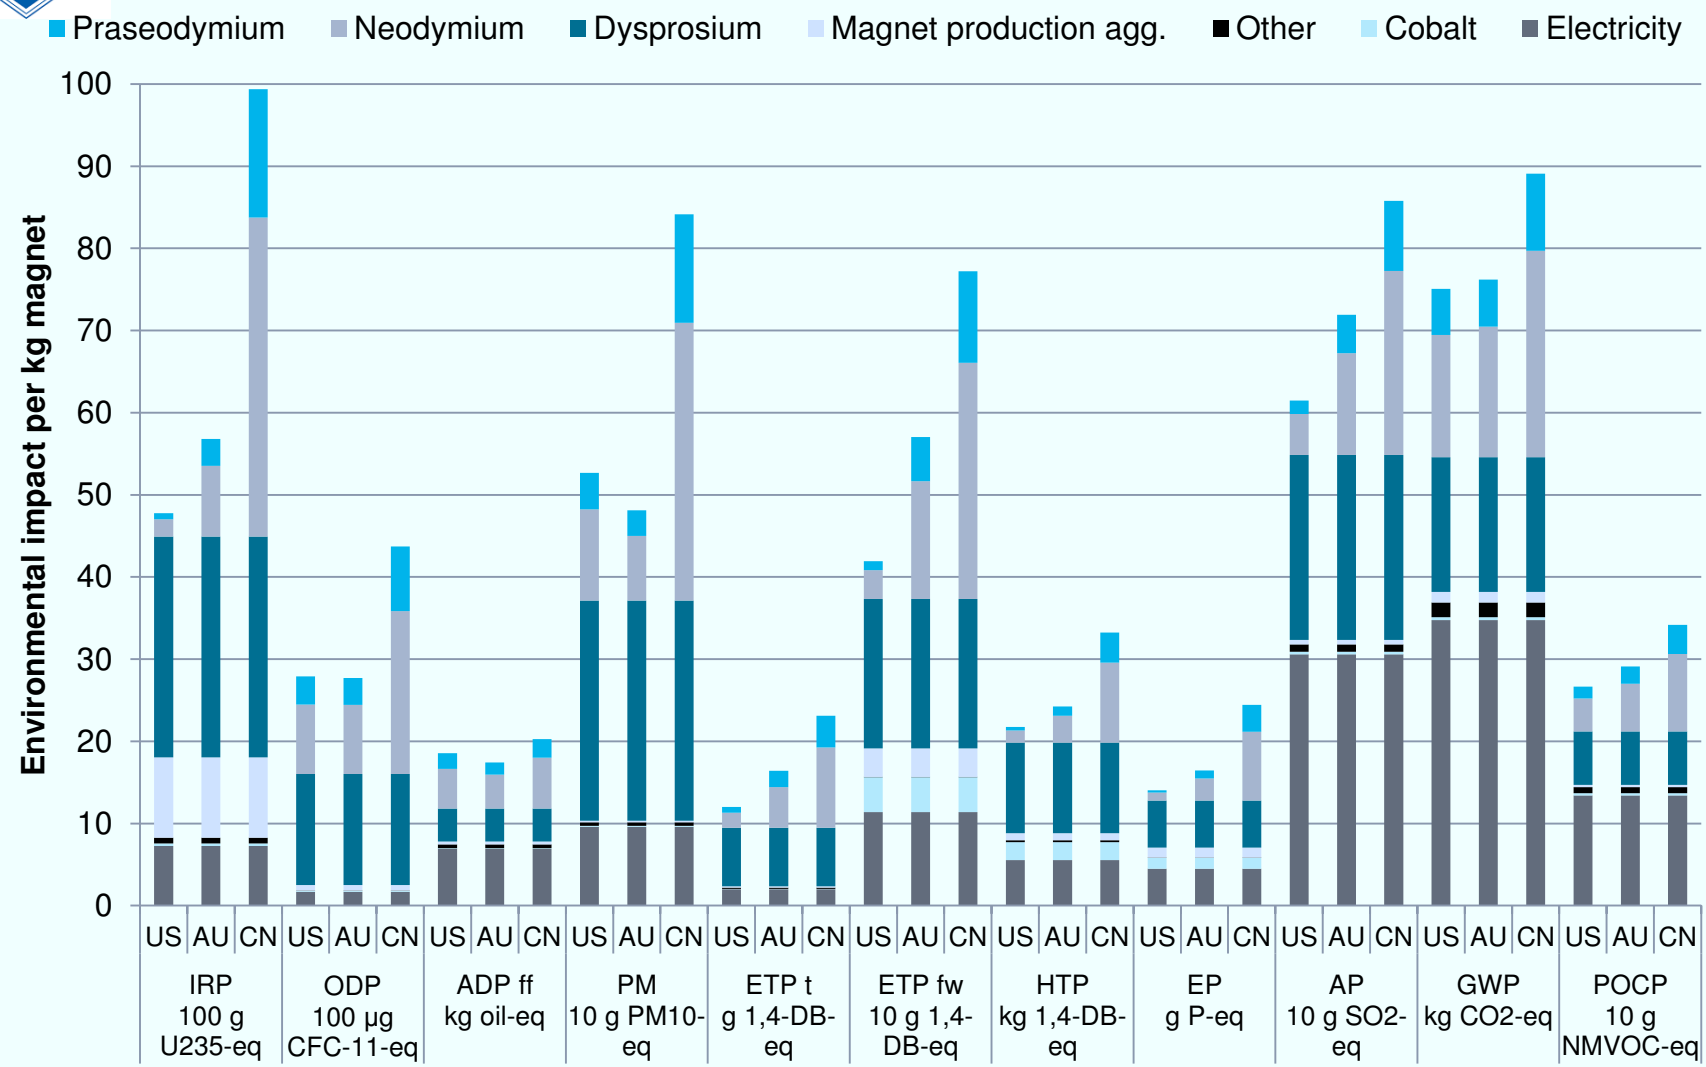
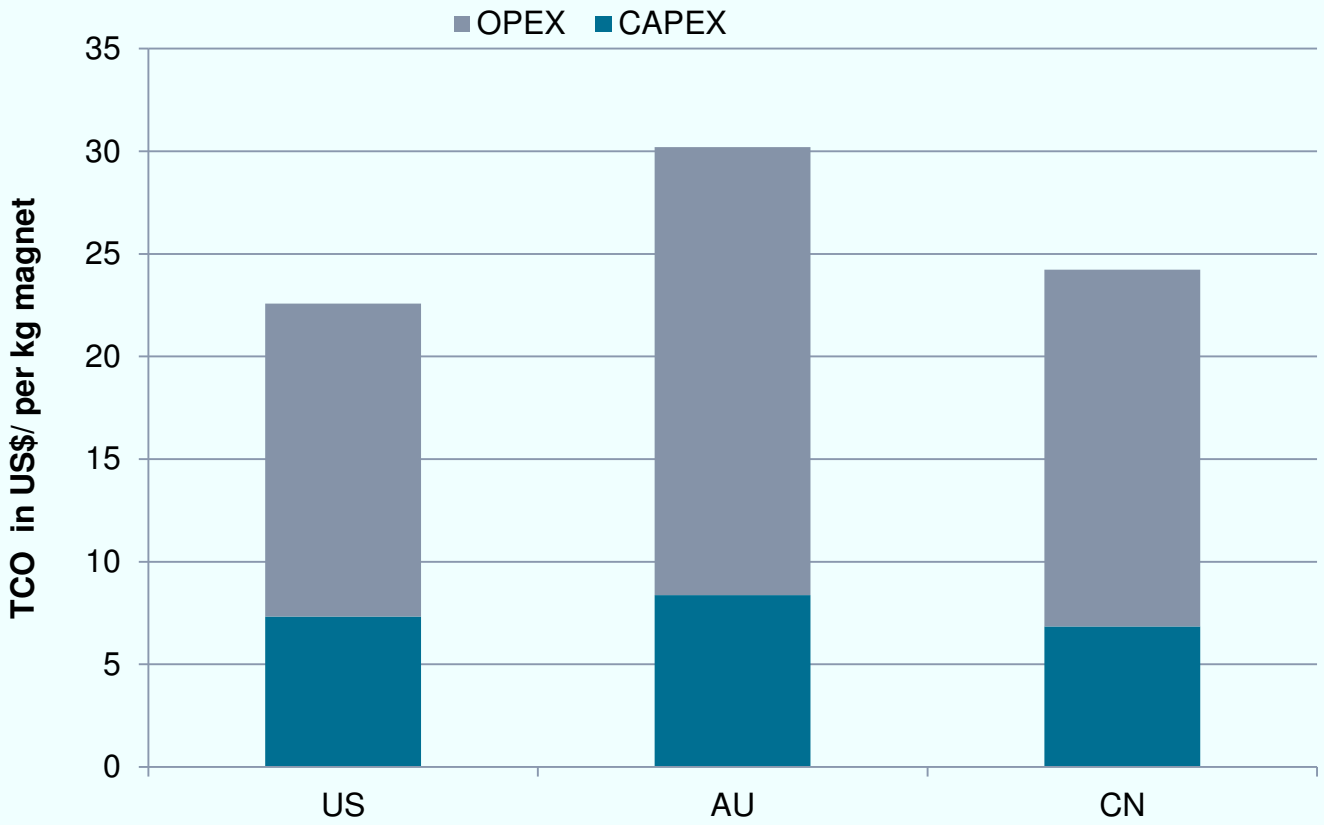
Results LCA



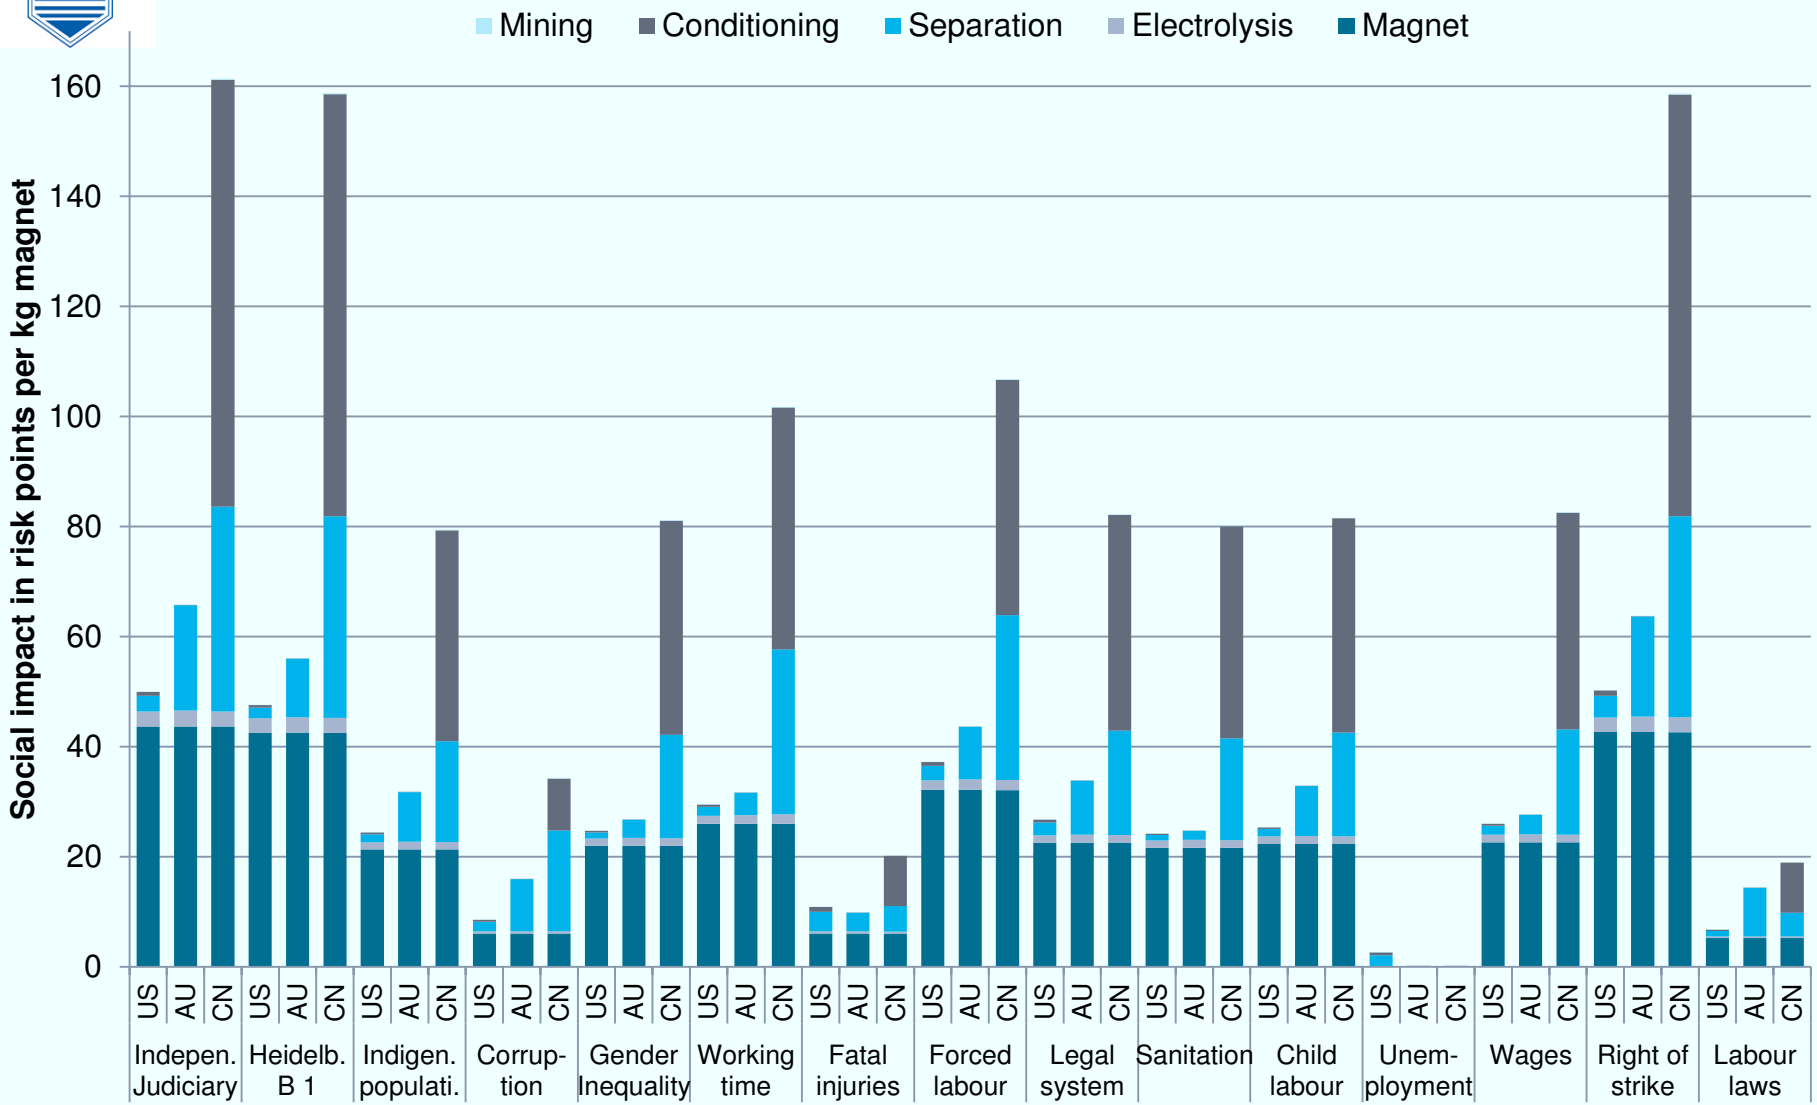
Member of the Helmholtz Association

Results LCC



Member of the Helmholtz Association

Results s-LCA

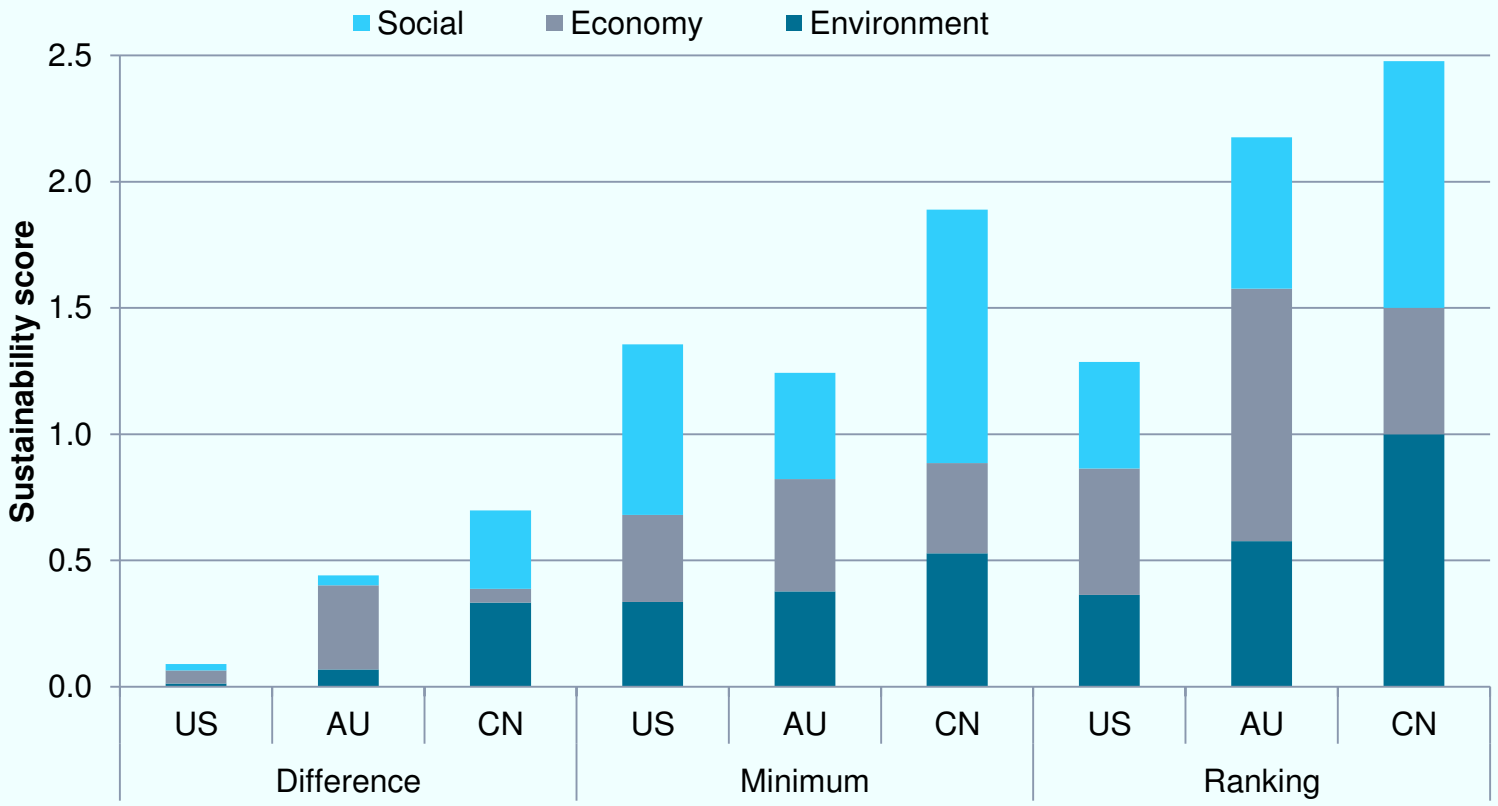


Multi-criteria decision-making

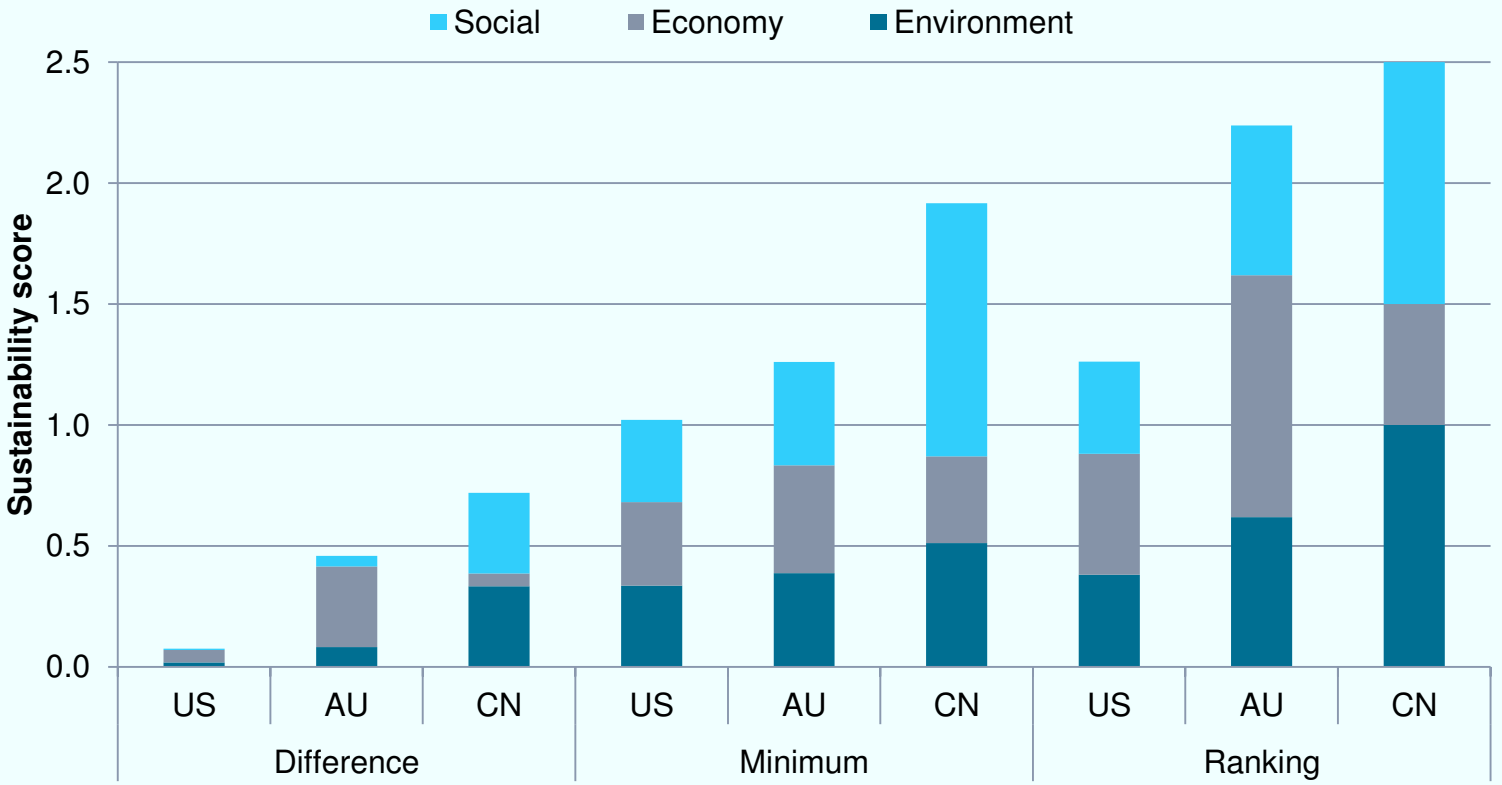
- Normalization
  - Difference/min-max $\widehat{x_{ij}} = \frac{x_{i,j} - x_{i,min}}{x_{i,max} - x_{i,min}}$
  - Minimum
  - Ranking
- Weighting
  - Equal weights per sustainability dimension + equal weights per indicator
- Aggregation
  - Weighted sum

Member of the Helmholtz Association

Results MCDM



Results MCDM indifference threshold



Conclusions

- Chinese products reach highest environmental impacts mainly due to poor waste water and sludge treatment
- OPEX always significantly higher than CAPEX – OPEX strongly influenced by chemicals, waste treatment and energy
- Most influential social indicators are
  - Characterization of Heidelberg Barometer1
  - Characterization of CIRI Independent Judiciary
  - Risk that a country lacks or does not enforce the right of strike
- RE permanent magnets from China are least sustainable
- Different normalization methods can influence the overall result
